Agenda

Problem &
Business Case

Data
Preparation &
Features

Model Strategy
& Results

Impact & Next
Steps

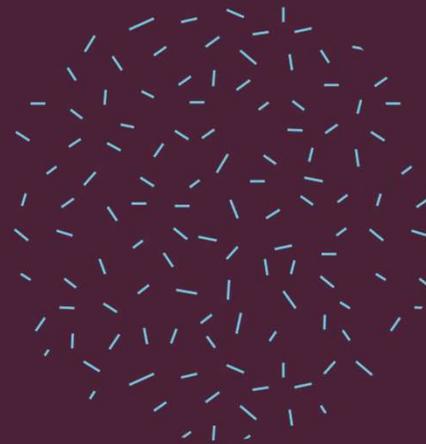

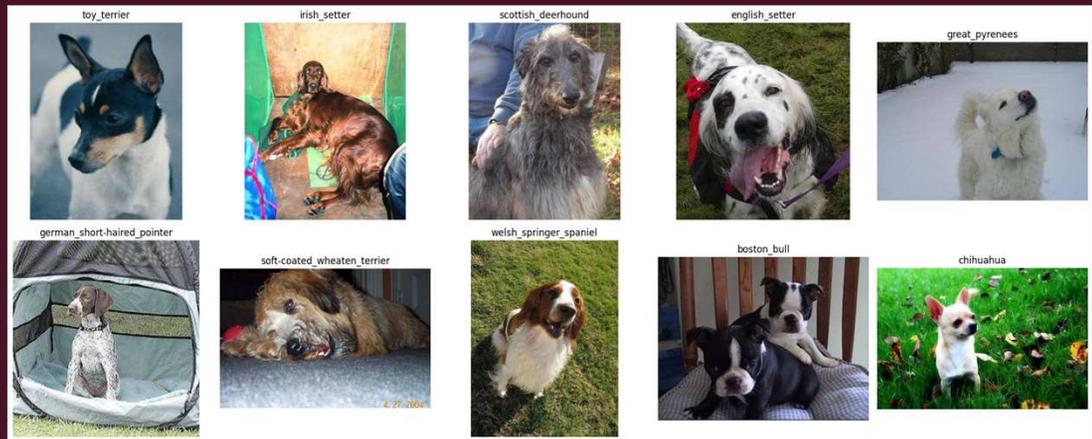

Why it matters

- Operational Efficiency
- Improved Family Satisfaction
- Error Reduction

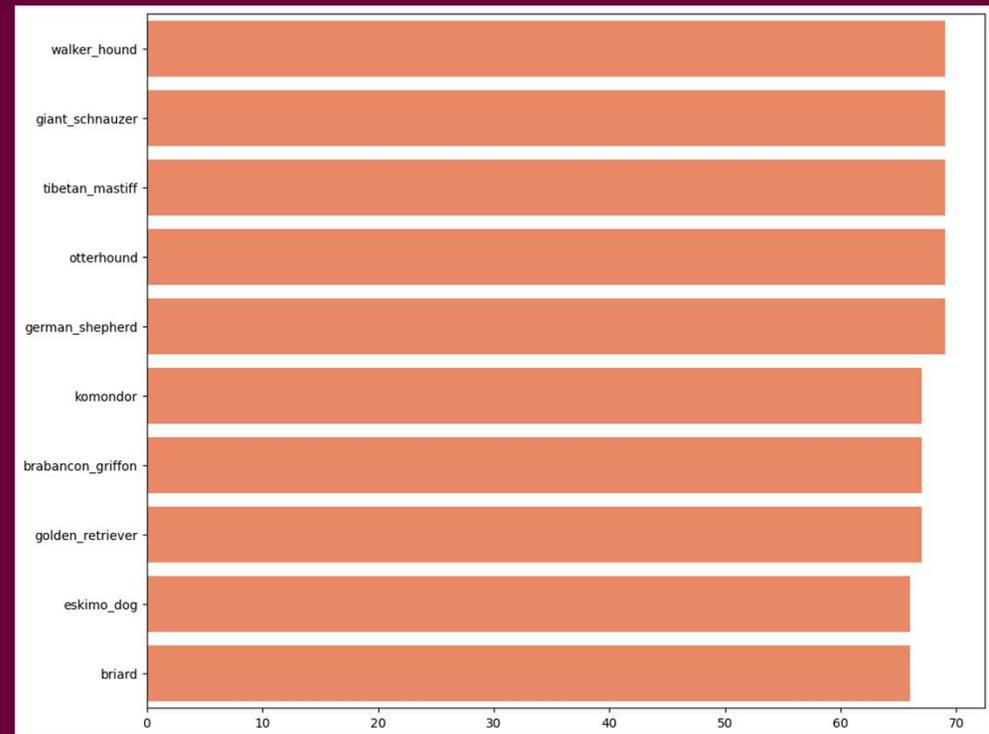

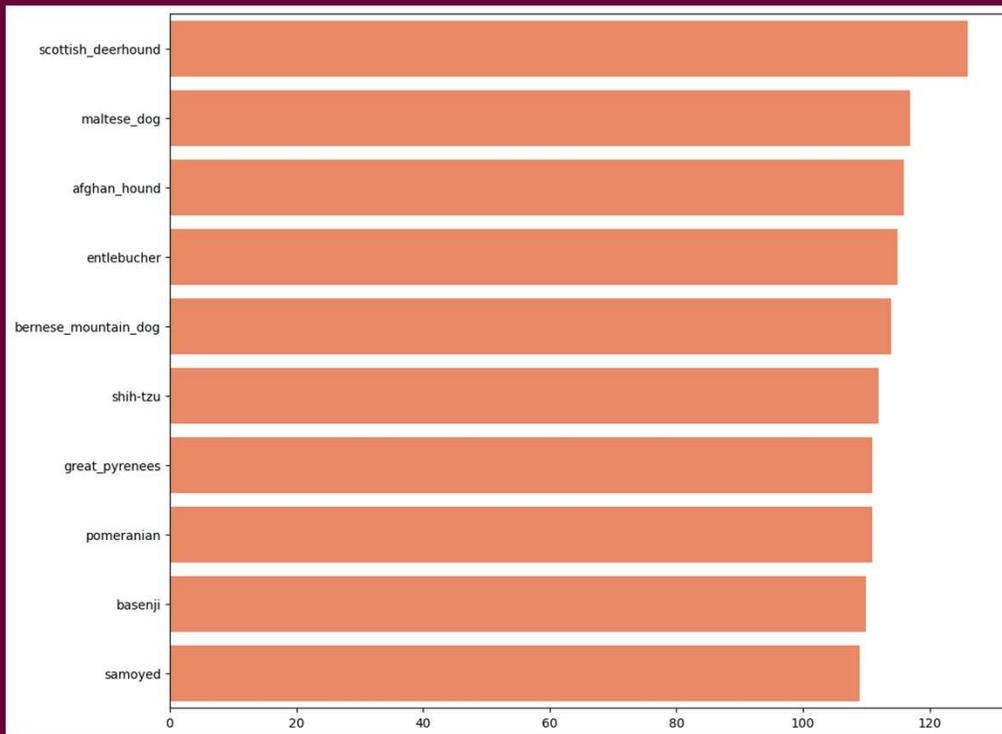

Data Exploration

- 120 total dog breeds
- 10222 total images
- 70% train 30% test
 - 15% val / 15% test

Top and Bottom 10 Breed Distributions

Modeling Approaches

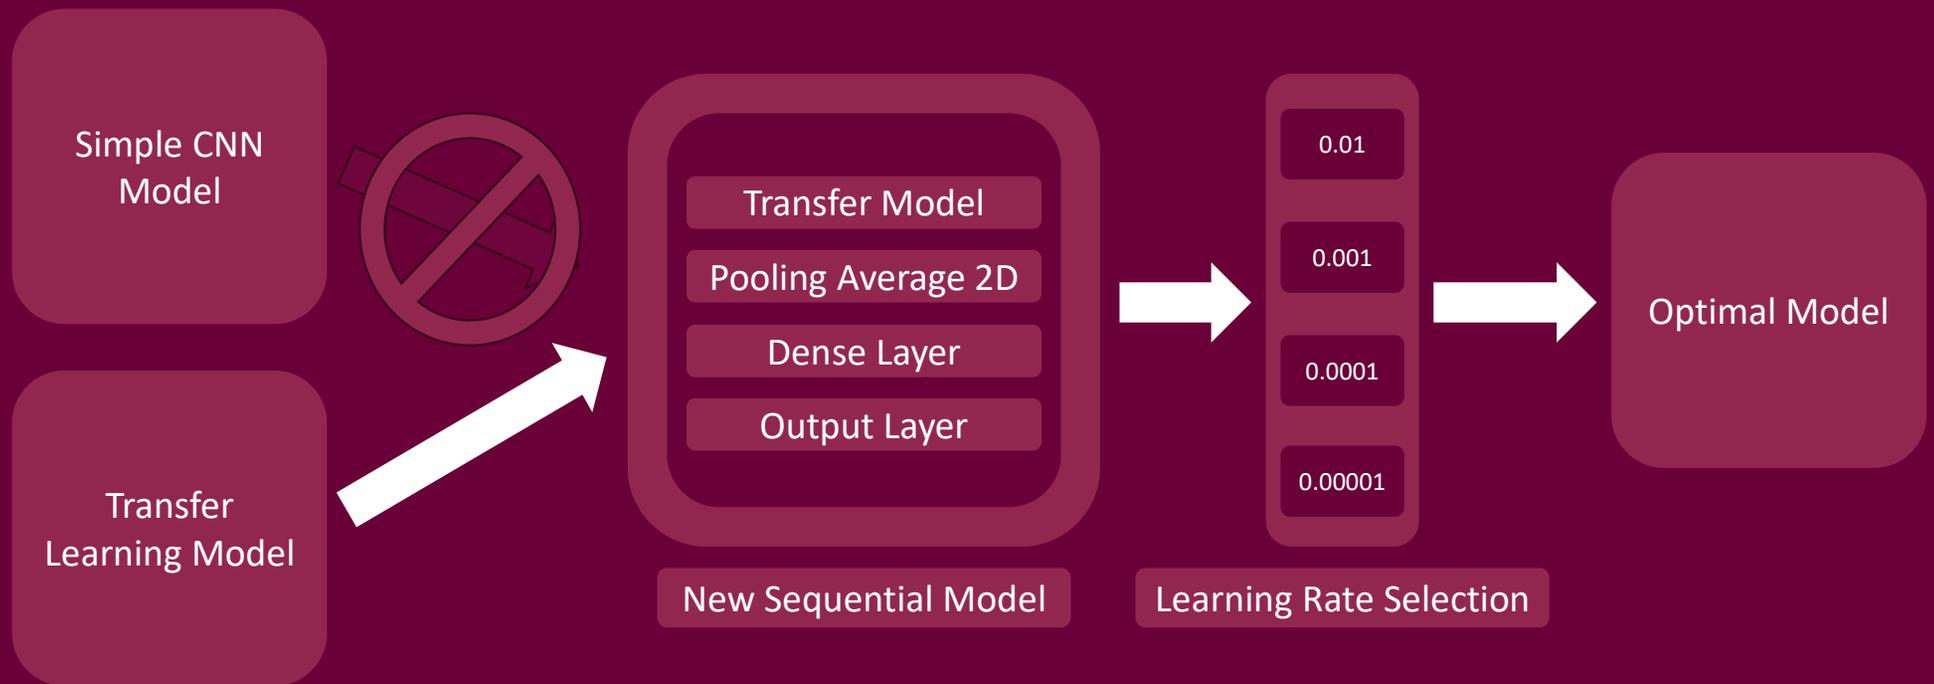

Baseline Model

- Simple Neural Network (CNN)
- TensorFlow
- 3 layers

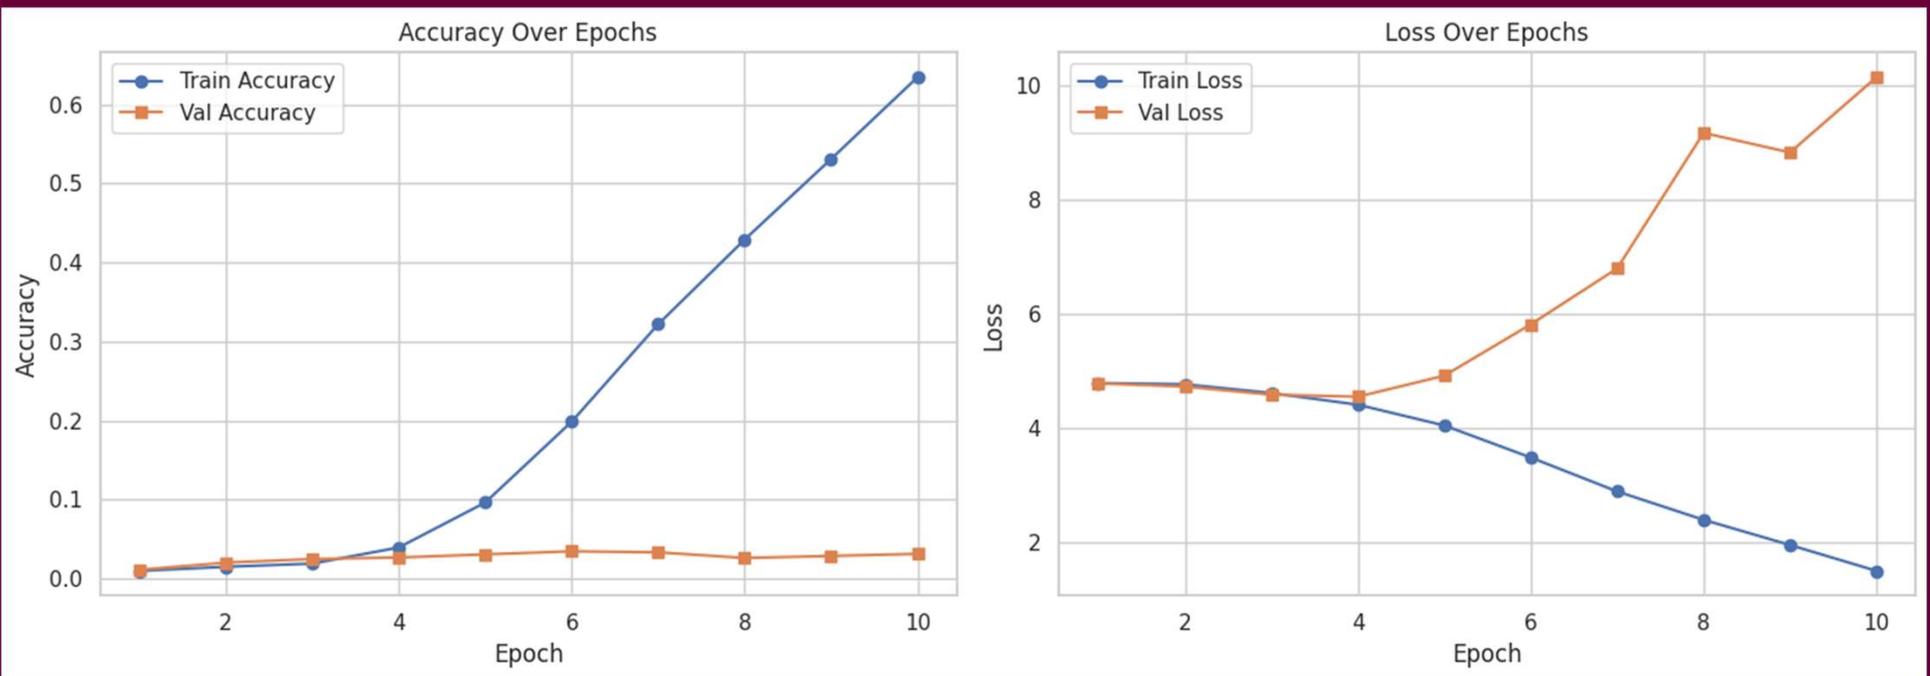

Deep Transfer Learning

- MobileNetV2 base model
- Custom classification layers
- Compiling and training

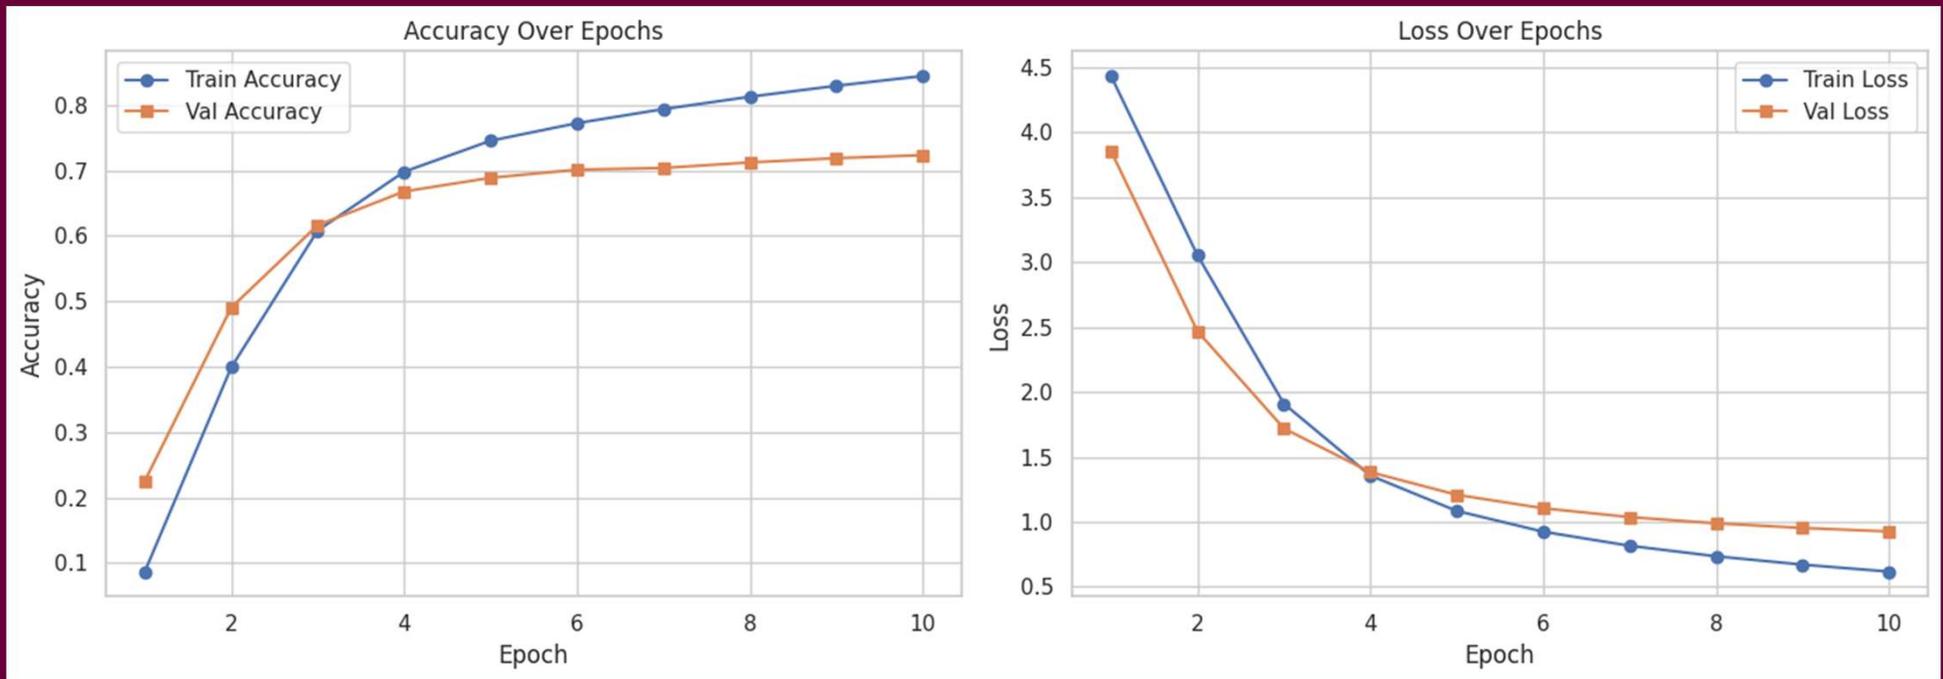

Model Tuning and Optimization

Simple CNN Performance

Transfer Learning Performance

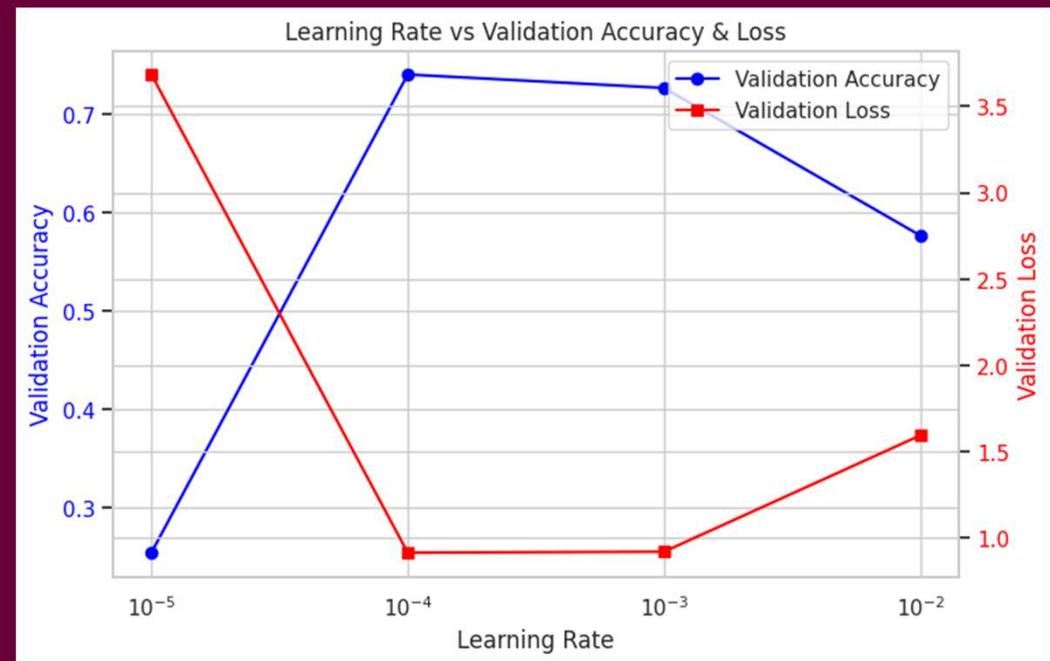

Evaluation Metrics

Simple CNN Model

- Accuracy: 0.03
- Loss: 20.81

Deep Transfer Learning Model

- Accuracy: 0.74
- Model Loss: 0.93
- Weighted Average F1: 0.73

Conclusion and Business Impact

Key Findings:

- Baseline CNN
 - High training performance but very low validation performance
 - Severe overfitting → poor generalization
- MobileNetV2 (Transfer Learning)
 - Strong initial performance
 - Hyperparameter tuning (learning rate = 0.0001) optimized results
 - Final model maintains strong validation performance
- Comparison to Baseline Accuracy
 - MobileNetV2 dramatically outperforms both naive baseline and CNN

Impact:

- This allows Santa's Workshop to match uploaded dog photos to the correct breed instantly, reducing manual elf workload and minimizing routing mistakes.

Next Steps

Build a
structured
pipeline

Establish Global
Scale
Deployment

Multimodal
Integration
- NLP for letter
analysis
